Statement of Necessity

This dossier provides the required financial specification to convert theoretical homelessness resolution frameworks into investable real estate assets, directly solving the first-mover capital risk gap.

Author's Note

This paper is the fifth working paper in the Material Dignity Infrastructure series.

1. EXECUTIVE SUMMARY

Chronic urban displacement represents a structural architectural failure requiring systemic capitalization, rather than a moral deficit requiring philanthropic mitigation. Los Angeles currently absorbs two billion dollars annually in sunk operational costs responding to emergency biological decay. The Material Dignity Infrastructure (MDI) framework converts these catastrophic municipal liabilities into collateralized, cash-flowing real estate equity.

We propose acquiring One California Plaza at deeply distressed valuations (sub-replacement cost) to establish the first fully functional MDI prototype. The facility will stabilize one thousand metabolically compromised individuals, generating fifty thousand dollars per capita in verified avoided municipal costs. Autonomous replication across global capital markets initiates immediately following the Day 365 performance audit.

2. CAPITAL STACK AND YIELD MECHANICS

Executing the One California Plaza prototype requires 220,000,000 USD in total capital. This figure encompasses acquisition costs, facility adaptation, Day One stabilization reserves, and thirty-six months of capitalized interest. The capitalization structure explicitly bridges the gap between unproven operational theory and institutionally deployable financial instruments.

Tranche A (Catalytic First-Loss Equity) totals 88,000,000 USD (40% of Capital Stack), targeting mission-driven family offices utilizing Program-Related Investments (PRIs). It carries a deferred four percent target yield. This tranche absorbs initial operational volatility during the facility stabilization phase, de-risking the senior debt.

Tranche B (Senior Concessionary Debt) totals 132,000,000 USD (60% of Capital Stack), targeting Community Development Financial Institutions (CDFIs) and mission-aligned commercial lenders. It carries an eight percent current target yield. Tranche B operates as traditional commercial real estate debt, strictly secured against the physical asset.

3. LEGAL ARCHITECTURE AND GOVERNANCE

The MDI framework explicitly rejects municipal procurement dependency. The Tripartite Coalition establishes autonomous operational governance utilizing two distinct corporate entities to isolate liability from physical assets.

Entity One is a Delaware Statutory Trust (DST) serving as absolute title holder for the physical real estate. It employs zero operational staff. This absolute separation guarantees that operational liabilities cannot attach to the physical real estate.

Entity Two is a California Public Benefit Corporation (PBC) serving as exclusive operational manager and clinical service coordinator. The PBC leases the facility from the DST. The PBC absorbs all operational liability. In the event of catastrophic operational failure, the PBC can be dissolved without jeopardizing the physical real estate held by the DST.

4. SOVEREIGN REVENUE MECHANICS

Operational sustainability for the MDI prototype relies entirely upon sovereign state funding via Medicare and Medicaid (Medi-Cal). The California Public Benefit Corporation bills managed care plans directly for services rendered to the stabilized population under the CalAIM Community Supports framework.

Core HCPCS Billing Codes include H0043 U6 (Housing Transition Navigation Services), H0044 U2 (Housing Deposits), T2050 U6 (Housing Tenancy and Sustaining Services), and T2033 U6 (Re recuperative Care).

Los Angeles County currently expends approximately 50,000 USD annually per unsheltered individual. The MDI prototype captures this value through CalAIM billing. Sovereign billing initiates immediately upon resident intake. Full operational break-even is projected at Day 270, with stabilized positive cash flow generated exclusively through sovereign reimbursement channels by Day 365.

5. STRUCTURAL RISK MITIGATION

Institutional capital strictly requires comprehensive risk isolation. Tranche A explicitly absorbs first-mover demonstration risk. Once Day 365 performance metrics validate CalAIM revenue streams, the demonstration risk reaches zero, unlocking traditional institutional refinancing.

Operational liability contagion is mitigated through the Tripartite Coalition, which legally isolates the physical asset within the Delaware Statutory Trust. Political interference is mitigated because the MDI prototype operates entirely independently of municipal funding. Revenue volatility is mitigated by a fully funded 10.56 million USD capitalized interest reserve, guaranteeing thirty-six months of Tranche B debt service regardless of operational billing velocity.
